

Your Diploma Thesis Title

Thesis Presentation

Your Full Name

2026-06-29

International Hellenic University

1. Introduction

1. Introduction

1.1. Problem Statement

1.2. Objectives

2. Background

3. Methodology

4. Experiments

5. Conclusion

- The problem you are addressing is significant
 - ▶ It has real-world impact and relevance
 - ▶ Existing approaches have limitations
- This motivates the need for a new solution
- Your work aims to fill this gap

Describe the main objective of your thesis:

- First key objective
- Second key objective
- Third key objective

What is the novel contribution of this work?

2. Background

1. Introduction

2. Background

2.1. Related Work

2.2. Theoretical Foundations

3. Methodology

4. Experiments

5. Conclusion

Overview of prior research:

- **Approach A:** Brief description and limitations
- **Approach B:** Brief description and limitations
- **Approach C:** Brief description and limitations

Your work improves upon these by...

Introduce the necessary theory:

1. First concept with explanation
2. Second concept with explanation
3. Third concept with explanation

Mathematical formulation if needed:

$$f(x) = \int_{-\infty}^{\infty} \hat{f}(\xi) e^{2\pi i \xi x} d\xi$$

A key theorem or lemma that underpins your work.

3. Methodology

1. Introduction

2. Background

3. Methodology

3.1. Proposed Approach

3.2. Implementation

4. Experiments

5. Conclusion

- Component 1: Description of the first component
- Component 2: Description of the second component
- Component 3: Description of the third component

Step 1: Preprocessing

```
output = transform(input)
```

Step 2: Core computation

```
pseudocode_of_algorithm(input):  
    result = initial_value  
    for item in input:  
        result += process(item)  
    return result
```

Step 3: Post-processing and evaluation

- **Language / Framework:** version X.Y
- **Libraries:** lib1, lib2, lib3
- **Hardware:** specifications

Code Example

```
def example_function(param1, param2):  
    """Example of a function used in implementation."""  
    result = param1 * param2  
    return result
```

4. Experiments

1. Introduction

2. Background

3. Methodology

4. Experiments

4.1. Experimental Setup

4.2. Results

4.3. Ablation Study

5. Conclusion

Dataset	Size	Description
Dataset A	1,000 samples	Description A
Dataset B	5,000 samples	Description B

- Baseline methods used for comparison
- Metrics: accuracy, precision, recall, F1-score
- Cross-validation strategy

Quantitative Results

Method	Accuracy	Precision	Recall	F1
Baseline	XX%	XX%	XX%	XX%
Ours	YY%	YY%	YY%	YY%

Key observations from the results:

- Our method outperforms baselines in metric A
- Improvement is statistically significant ($p < 0.05$)
- Trade-off observed in edge cases

Insert

gram
here
(../a
sets

Configuration	Performance
Full model	YY%
Without component A	YY%
Without component B	YY%

Each component contributes positively to overall performance.

5. Conclusion

1. Introduction

2. Background

3. Methodology

4. Experiments

5. Conclusion

5.1. Summary

5.2. Future Work

5.3. Thank You

1. **Finding 1:** Most important result from your work
2. **Finding 2:** Second most important result
3. **Finding 3:** Third most important result

- **Contribution 1:** What was achieved
- **Contribution 2:** What was achieved
- **Contribution 3:** What was achieved

- Immediate extensions and improvements

- Broader research directions enabled by this work
